

Project Packet

1. Review the following seed dispersal and explosion charts from Montessori Botany lessons.
 - Brainstorm the students how different seeds spread widely and farther away from their ancestors.
 - In the later activity we will use touch me not flowers for fingernail dye for fun. (The explosion chart is for touch-me-not flowers. Their seed dispersal is an explosion case.)

Have you ever wondered if you travel far away from home but you still maintain your tradition just like these seeds?

As human beings, we always look after our ancestors. Why is that? Show the students' one of the Great Lesson experiments. Do you remember when we had our first Great Lessons? It is called **Forces of Attraction**. (For this lesson, you will need punched papers and water in a bowl. Have the papers scattered in a bowl and see how the papers move along.) You can observe this here very clearly. Some of the particles are very attracted to each other while others repel. Likewise in our lives, the same rule applies. There are rules of 2:6:2. Two people will love you no matter what. 6 people do not care. 2 people will not like you no matter what. This rule has been always the same way for many many years.

Project Packet

- Description of Project

I'd like to use this Project Packet to study their Blood Types which is a very unusual activity to American students. DNA is a science portion and inherited to the young generation. According to the Korean blood type myth, there are some blood types that can be strongly associated with each other that can get along well while others can be a disaster in terms of relationships.

Students will need to complete one or two (or more if they wish) of these following activities.

1. Students can identify their blood type.
2. Make a family tree poster to find out all of their family members' blood types.
3. Try to get to know their classmates' blood type and find out which one could have a good relationship or which one does not.
4. This is just a fun activity to find out but if they want to continue learning further about personality they can explore to learn more about MTBI personality analysis. There are online resources.

Project Packet

If you have traveled far away from your family, you might still find something similar to your family traits, for example, your favorite food, habits that you have, or things you do. This is the power of genes running through your family blood. In South Korea and Japan, it is very popular to find someone who attracts you or repels you depending on the blood types. Blood types have been a fun way to Korean people to learn more about others, similar to horoscopes here.

1. You will be doing research to determine your blood type first. You will need to know your blood type first so that way you will find who is the person you can get along with or vice versa.
2. 1st period lesson: Forces of Attraction lesson from Montessori Great Lesson. You will need to see why we are doing that experiment. There is always someone who likes you or dislikes you.

2nd Period Lesson: Find your blood type and find your classmates, friends, or family members blood type to see how the relationship has been with you depending on your blood type. Do your research and study more about blood type and personality. MBTI personality test online as well.

<https://www.16personalities.com/free-personality-test>

3rd Period Lesson: Summarize your learning all you know about blood type projects. You can make a family tree, a poster, PowerPoint, a skit or it could be an artwork if you wish to paint or draw. Or you can make a journal writing about what you have learned.

- Project Option in case you do not wish to do family tree then you could do something else. Please see me if you'd like to have different options for this activity.

3. During our work period, we will discuss your projects. Please sign up for the date if available.

Your name	Dates (first week)	Dates (second week)
